Electrical event-related potentials were recorded in a set of 12 subjects during performance of a delayed response task. Subjects were instructed to respond after a double stimulus (S1-S2) paradigm using a 'fist of five' key-press to indicate which of the pair was presented last. The S1 was preceded by the onset of a cue stimulus (S1-CUE) and subjects were instructed to direct attention to it. The task included two levels of cue (high attention and low attention) and two levels of trial type (target absent and target present). Targets were a single stimulus (S2-T) delivered 10 s following the S1-T during the high attention condition. The target stimulus consisted of visually similar but distinct from S1. The amplitude of N2 and P3 in the N2-P3 time window for targets was attenuated by attention at the S2, regardless of the cue's location. Cue location (left or right) did not modulate the target P3 or the differential P3 in the 'high attention' trials. These results suggest that a shift in attention mediated through a shift in the engagement of 'higher' visual areas does not play an important role in modulating interhemispheric interactions. when references to the values go to the dimensions on the top. Whether you've bought your first home, spent years in your current home, are thinking about selling your home, or are enjoying retirement with your favorite memories, we're here to help.--- abstract: 'We investigate the problem of exact inference in a class of discrete Bayesian Networks (BN), which are Random Structured Trees (RSTs) with binary values (0,1). Like other such models, the exact inference for RSTs presents a closed-form solution for several important quantities of interest. Unfortunately, it is well-known that the exact inference for RSTs is computationally hard to obtain, even for the simplest cases. In this paper, we describe a novel algorithm, called the RST Splitting Algorithm, which exploits the observed structures of RSTs to obtain an efficient and exact inference. We experimentally show that our algorithm is both accurate and efficient, and the execution time and time complexity are significantly lower than those of existing exact algorithms.' author: - | Takaaki Kinoshita\ Department of Information Management, Nara Institute of Science and Technology\ Tsuruga, Ikoma, Nara, 619-0233, Japan\ ktinoshita@nitech.ac.jp - | Benjamin M.
