Pale Ale: only the pale Nature does not like to play favorites. If it wants to be kind, it chooses to be even-handed. Thus, a typical redwood tree will lose the odd-shaped leaves at the end of a branch, yet have them right beside the ones on the rest of the branch. But if it wants to be mean, it will favor the odd-shaped leaves. That is, we are lucky to be alive today. This even-

handedness applies to nature's breweries. Pale ale does not get its name from its color; its color is a direct reflection of its ingredients. A Belgian pale ale, or white ale, is a beer that has been filtered through a cloth, resulting in cloudy particles floating in the head. The color of pale ales is a direct result of the fermentation of the sugary yeast. Fermentation generates a thick, gummy substance called diastase, which is the same protein that makes milk churn in your stomach. Diastase is a very strong protein, and it causes the grain, hops and yeast to have a "funky" taste and smell. It also gives the beer a cloudy appearance. Belgian pale ales made by brewers of the Trappist breweries in Belgium have a bottle that seems to glisten as if it was coated in diamond dust. Why? They are pumped through silver pipes and poured into bottles that have been coated with a special paper. These bottles are also bottled upside down (which would be an excellent idea in the first place). This, and the fact that most of the bubbles are trapped inside the b7e8fdf5c8
