First, you must obtain a cracked version of the software from a trusted source. Once you have downloaded the cracked version, you must disable all security measures, such as antivirus and firewall protection. After this, you must open the crack file and follow the instructions on how to patch the software. Once the patching process is complete, the software is cracked and ready to use.

Being able to zoom in on a photo to see more detail is the other big new benefit to the app. Unlike with the Lightroom app, you don't have to zoom in before you can see details, and the zoom bar isn't in the upper left. You can always move the zoom bar and keep it on the bottom so you can still see the entire photo. In fact, the top half of the screen is what you might expect with other iPad apps -- a preview of the photo's contents. Tap a thumbnail to open the photo, then tap the zoom bar to enter "pan mode." The zoom bar is where the normal zoom feature is as well. You can now use your finger to "slide" the zooming in by moving your finger from the center to the edge of the screen. The zoom button (the eye) in the upper left switches to standard mode when you tap it, so you can zoom in or out, depending on which direction your finger moved. The menu button (a circle with the square through it) opens a menu with tools for adjusting the photo. The other five tools are the Crop, Rotate, Flip Horizontally, and Flip Vertically options. You can now also drag a photo in from the Photos app. Tap the desired image, its thumbnail opens, then tap and hold the photo and move it in. So in the screen above, you can see that the image is open and there's a box around it. For example, the whole Camera RAW system is still a work in progress, a term that has new meaning in this context. Camera RAW was already a very sophisticated plugin, with its own extremely intelligent object-based editing capabilities. But Lightroom 5 brings new smarts to the table, including Adobe's new "advanced processing", which aims to fix and enhance images, especially photographs. This seems like a pretty obvious direction for Lightroom, and to be honest, it's long overdue. companies are already deploying such technology to process the photographs they capture on smartphones and small point-and-shoot cameras.
